JES²Mail and JES²FTP

Release Announcement

Release 4.4.0 – April 1, 2006

JES2FTP

- **SSL/TLS Support.** JES2FTP can now use SSL/TLS protocols for secure data transmission.

- **gZIP support.** When you have a big file to transfer, the amount of memory required for ZIP may be more than you want to allow. The gZIP format, which is supported by almost anything that supports ZIP, is a continuous compression mechanism. There is no limit to the file size that can be compressed.

- **Improved FTP Directory Handling.** Changes have been made to better handle situations where the target FTP directory has a very large number of files.

- **SMF reporting.** SMF records can now be generated that will report JES2FTP activities.

JES2Mail

- **Archiving Emails.** A new configuration and ruleset option allows the specification of a 'blind' copy destination for all outbound emails.

- **Improved email notification.** A new option for the email notification mechanism is to perform the email operation internally, resulting in much faster performance. Also, this works with the Windows Report2Mail version of the program.

Changes for both products

- **RecognizeBy and Wildcard Matching.** The RecognizeBy mechanism for report selection within a ruleset has been expanded with wildcard character support. For example: "RecognizeBy: Jobname eq PBX*" would select all jobs beginning with "PBX".

- **EXCI support.** Supplied programs show how to get a 'report' from a CICS TS-Queue and store it in an MVS dataset for processing by JES2xxx.

- SMF records can also be generated in a summarized format.

Windows Version – Report2Mail

- **A Windows version, Report2Mail, is available.** A beta version of the program is available that runs from a command prompt (or bat file) on a Windows machine. The major functions of JES2Mail/FTP are all supported including RPL scripting language and overlays. This is being made available for testing purposes and is a part of the JES2Mail/FTP download. This beta version will be operational through 2006.
